Abstract In 1993, the Colombian Government created a subsidized health care regime (SR) in order to increase coverage among the poorest population. Using data from the 2008 and 2012 Colombian Living Standards Survey, I estimate the association between SR participation and household food insecurity. Enrollment into the SR is not exogenous due to self-selection from potentially eligible households, discretionary municipalitylevel policies that affect eligibility, and manipulation of the assignment process for electoral purposes. Therefore, I use the proportion of lifetime the household head has resided in the current municipality as an instrumental variable. Taking the uninsured population as the comparison group, the two-stage least squares regression estimates reveal that participation in the SR is associate with a reduction of the probability of being food insecure, principally in rural areas. This result is robust in the standard of the probability of being food insecure, principally in rural areas.		Ilt of collaborative work with individuals from other national or international institutions. This xed at Research Papers in Economics (RePEc)
