Financial inclusion is the process of integrating financial services into the daily economic activities of the population, which can contribute to economic growth to the extent that it reduces financing and transaction costs and offers secure and efficient management of resources, both for households and companies. The measurement of financial inclusion encompasses different dimensions of access and use of financial products by households and companies, including coverage, transactionality, savings, credit, insurance, quality, and welfare.

This report presents a diagnosis of financial inclusion for both men and women in Colombia. For this purpose, some variables related to financial inclusion reported in the Global Findex for Colombia and others reported in the DANE microbusiness survey are analyzed. Additionally, a comparison is made between the characteristics of loans granted by credit institutions to women and those granted to men between 2017 and 2021 using Format 341 of the Financial Superintendency of Colombia (SFC). This paper is the first to approach financial inclusion from a gender perspective, taking such administrative data into account.
